Steps I did to create my First AWS Virtual Machine:

1. Navigated to **Amazon Elastic Compute Cloud (EC2)** in the AWS Management Console.
2. Launched a new virtual server (instance) and name it **testlab1**.
3. Selected **Ubuntu Server** as the Amazon Machine Image (AMI).
4. Created a new key pair named **testkey2** and choose the **.pem** format (for use with OpenSSH). This action downloads the file **testkey2.pem**.
5. Left the **Network Settings** as the default configuration.
6. Did not modify any options in **Configure Storage** or **Advanced Details**.
7. Reviewed the configuration in the **Summary** section.
8. Launched the instance.
9. Opened the **EC2 Instance Connect** tab and connect to the instance using its **Public IPv4 address**.
10. In the Ubuntu cloud shell, I typed **whoami** to confirm the active user is **ubuntu**.
11. Typed **ls** to verify that no files are currently present.
12. Created a new file by typing **touch file.txt**, then run ls again to confirm the file has been created.
13. On my local computer, I opened the command line interface (**Command Prompt**) and navigated to the **Downloads** directory using **cd downloads**.
14. Went to the **SSH Client** tab in the AWS console, copied the provided SSH command, and pasted it into the command line to connect to the AWS server.

Screenshots:

```
:\Users\dahir\Downloads>ssh -i "testkey2.pem" ubuntu@ec2-13-53-190-42.eu-north-1.compute.amazonaws.com
Welcome to Ubuntu 24.04.3 LTS (GNU/Linux 6.14.0-1018-aws x86_64)
